

Developer Manual - Client Management

Technical guide for maintaining the clients area in the central project.

Ramo	Client Management
Destinatários	Developers and technical maintainers
Repositório	https://github.com/MenteMovimento/central-mente-movimento
Site	https://central-mente-movimento.vercel.app
Atualização	23/07/2026

1. Central overview

The clients area is part of the Central MenteMovimento project. It runs inside the same Vercel deployment and shares the central authentication flow.

- Official repository: <https://github.com/MenteMovimento/central-mente-movimento>
- Production site: <https://central-mente-movimento.vercel.app>
- Main branch: main.
- Production build: `npm run build`.
- Vercel output directory: public.

2. Clients module structure

- Main backend: `portal/modules/utentes/app.py`.
- Serverless entry point: `api/utentes-app.py`.
- Original Supabase schema: `portal/modules/utentes/supabase_schema.sql`.
- Static manual PDFs: `portal/modules/utentes/docs/`.
- Main tables: `utentes`, `utente_abas`, `historico` and `utente_anexos`.
- Storage bucket: `documentos-utentes`.

3. Persistence and security

- SQLite is only for local development.
- Production must use Supabase and Vercel environment variables.
- Never expose `SUPABASE_SERVICE_ROLE_KEY` or `SUPABASE_SECRET_KEY` in frontend code.
- When changing record tabs, update `app.py`, translations, save/load logic and manuals.
- The sensitive `plano_intervencao` tab is stored as JSON in `utente_abas`. Preserve `plano_row_count` and every `plano_{n}_` field when evolving the form.
- Test the plan table with long text and printing: text areas must grow instead of hiding clinical or technical notes.
- Personal, social and health data must not be committed, logged or shared in screenshots.

4. Deployment workflow

- 1 Change code locally.
- 2 Run `npm run build` from the repository root.
- 3 Test sign-in, list, edit, attachments and manual links.
- 4 Commit with a clear message.
- 5 Push to main.
- 6 Check the automatic Vercel deployment.

Technical pre-release checklist

- 1 Run the manual generator whenever functionality changes.
- 2 Run `npm run build` from the repository root.
- 3 Open the Client Management area and test the changed workflow.
- 4 Test navigation between members, clients and cybersecurity.
- 5 Confirm that dark mode, language and the menu still behave globally.

- 6 Push to main only after the basic production checks pass.

Compatibility rules

- Do not rename production columns without a SQL migration and rollback plan.
- Do not remove fields used by import, export, indicators or history.
- Use absolute navigation paths such as /area/utentes/ instead of relative paths.
- Keep translations updated when adding visible interface text.
- Never commit real exports, attachments, local databases or private keys.

Production troubleshooting

- If Vercel fails, check deployment logs and environment variables.
- If Supabase returns session errors, verify service role and database permissions.
- If a Python route fails, check imports, filesystem paths and serverless limits.
- If an old PDF is still shown, clear browser cache and confirm the file was copied to public.
- If the app is slow, inspect repeated requests, large lists and render loops.
